WHAT IS SKIN RESURFACING?

Years of sunlight, even incidental, breaks down collagen and elastin fibers responsible for keeping skin youthful and firm. Skin resurfacing is a procedure to smooth your skin, repairing dullness and damage from wrinkles, acne scarring, or other causes. The FDA approved, fractionalized resurfacing laser, Pixel®, is your solution. It provides the best of both worlds, with highly effective laser resurfacing and minimal down time.

HOW DOES THE PIXEL LASER WORK?

A laser beam passes through the patented Pixel micro optics lens and penetrates the skin. These microscopic sites of thermal impact stimulate the process of collagen remodeling. This results in smoother, firmer skin texture.

The Pixel laser emits very thin beams of infrared light that stimulate the body’s collagen production and new, healthy skin cells. Unlike other skin resurfacing technologies, only a portion of the skin is treated while leaving the surrounding tissue intact. Because the surrounding skin is left untouched, the skin heals much faster and down time is minimal. This treatment method also encourages collagen remodeling, skin tightening, and improvement in skin texture.

Pixel treatments are typically administered once per month for three to six treatments. Your final results will continue to improve for three to six months after your last treatment as your skin continues to produce new collagen.

WHAT DOES THE PIXEL LASER TREAT?

The Pixel targets fine lines while boosting the skin’s natural collagen production to renew its firmness and texture. The Pixel is also utilized for minimizing the look of pore size, fine lines and wrinkles, and reducing the appearance of scarring. Skin with acne scarring can specifically benefit from this treatment, improving skin texture and reducing the appearance of scars. In addition, the Pixel is used for treating melasma which is hyperpigmentation often related to hormonal or genetic issues.

For facial lines and wrinkles caused by expression, Botox® and Dermal Fillers may also be recommended in combination with Pixel treatments.

HOW MANY TREATMENTS WILL I NEED?

Pixel Skin Resurfacing requires a minimum of three treatments for treating the face (face to jaw line) or face and neck. For deeper correction, up to six treatments may be recommended. Ask for a customized product regimen to optimize your post-procedure results.

WHAT DOES PIXEL TREAT?

- ACNE SCARRING
- LARGE PORES
- FINE LINES
