

SPIDER VEINS AND BROKEN CAPILLARIES

Erase Unsightly Blemishes

WHAT ARE SPIDER VEINS?

Spider veins are small blood vessels that appear close to the surface of the skin. They can occur anywhere on the body, and are sometimes referred to as broken capillaries when they appear on the face. Sometimes confused with varicose veins, which are raised, spider veins are flat on the skin.

HOW ARE SPIDER VEINS TREATED?

Using a precise handpiece, each vein is targeted with an intense light applied in a series of gentle pulses. Without damaging the outer layer of skin, the light penetrates through the skin and is absorbed by the hemoglobin being targeted in the vein. The vein will darken or change color before it is absorbed by the body as part of the natural healing process.

WHAT ARE THE RESULTS?

Most clients will experience significant reduction in the appearance of veins, to the point where they are no longer noticeable. However, due to everyone's unique physiology, some clients may need a few additional treatments in order to fully address stubborn veins and achieve their personal level of desired results.

WHAT MAKES SONA MEDSPA'S TREATMENT UNIQUE?

The use of laser technology allows you to receive treatments quickly with no downtime after treatment and no need for compression garments. Most clients report minimal discomfort during the treatment process.

SUGGESTED TREATMENT PACKAGES:

Face and legs are most commonly treated. Vein treatments packages start at three treatments spaced six weeks apart. Your consultant will help you determine the number of treatments needed to address your individual concerns.

WHAT CAN BE TREATED?

Sona's technology can minimize the appearance of:

SPIDER VEINS

BROKEN CAPILLARIES
